

HOLMES APPROVED PRODUCTS & AMVIC BUILDING SYSTEM

A Message from MIKE HOLMES, *North America's Most Trusted Contractor*

I've been a contractor for over 30 years, and I've seen the damage when the wrong products and materials are used. That's why I partnered with Amvic—so homeowners know what products help protect their home.

I use Amdry because it's key to building and renovating a home right—especially when it comes to basements. I see a lot of mould and heat loss in basements. A home could be losing as much 60 percent of its heat through the basement! That's unacceptable.

If you're finishing a basement, you need to make sure it's protected—not just from mould and moisture, but also from heat loss. Amdry takes care of all that for you.

Amvic's Amdry sub-flooring panels have moisture- and mould-resistant EPS foam insulation on one side with raised drainage/air-circulation channels and OSB sheathing on the other. The foam provides a continual thermal break across the entire floor surface, so you're stopping heat loss and saving energy—your floors are warmer, too. But it also stops the cold concrete floor from coming into contact with the warmer indoor air. That prevents condensation. And if there is any moisture or condensation build-up, the drainage channels allow it to dry out.

Amdry is ahead of the game. It tackles moisture, mould, heat loss and indoor air quality issues head-on, helping create healthier, more energy-efficient homes. When you build better, people live better.

Do you really get what you give? I believe it. I am proud of this partnership because together, Amvic with the Amdry panels and I are helping improve building standards from the ground up so you can have a better home.
